

1

## Goals

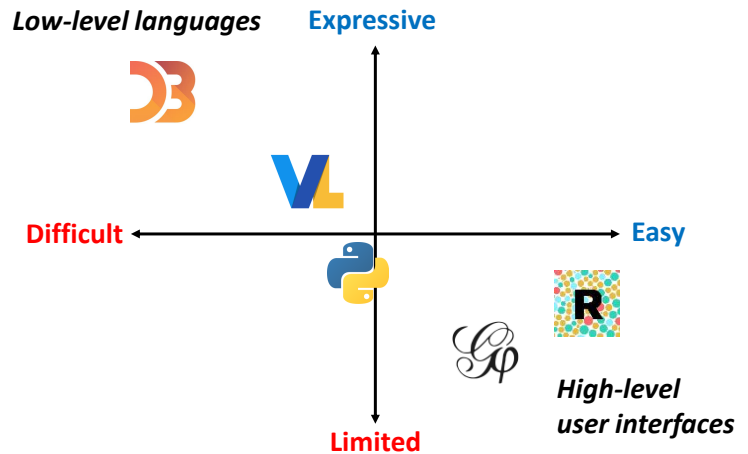

1. To introduce you to some popular visualisation tools
  - D3 & Vega-Lite via Observable
  - RAW Graphs
  - Python (+ vis libraries)
  - Gephi
2. To show you some visualisations I've been working on using real language data
  - Think about when/how you could use these tools (or similar) to create/customise your own visualisations

2

## Expressiveness vs Usability

“Visualisation tools sacrifice *generality* for greater *efficiency* performing particular tasks. Code has unparalleled expressiveness; it is the most general tool we have. A medium for discovery *must* be general. Creativity requires composition.”  
 – Mike Bostock, D3 Creator, 2017

3

## Disclaimer: A subjective selection

- There are many other powerful visualisation tools available!
- For instance, see this [overview](#) by Cameron Chapman

4

# D3 via Observable

5

## What is D3?

- D3 (or D3.js) is a JavaScript library that stands for *data-driven documents*
- Allows you to dynamically manipulate the Document Object Model (DOM)
  - Key concepts include selections, data-binding & the enter-update-exit pattern
  - Also supports data preparation, layout calculation, scales, shapes, animation, interaction and more
- Interactive, flexible, expressive and fast!
- See <http://shirleywu.studio/d3intro/>

### Document Object Model

6

1. Data preparation	2. Layout calculation	3. DOM manipulation	A. Finishing touches	B. Interactions
Array Statistics Search Transformations	Array Histograms	Selections Selecting Modifying Joining data	Axes Axis	Brushes Brush
Chords Chord	Chords Chord (ribbon)		Animation Interpolators Easings Timers Transitions	Dispatches Dispatch
Collections Objects Maps Sets Nests	Contours Contours		Color schemes Categorical Diverging Sequential Cyclical	Drag Drag
Hierarchies Hierarchy	Forces Force		Format Number format Time format	Quadtree Quadtree
Shapes Pies Stacks	Geographies Paths Projections		Scales (for color) Sequential Diverging	Selections Events
Time intervals Time intervals	Hierarchies Cluster Tree Treemap Partition Pack		Shapes Curves Links Symbols	Voronoi Voronoi
	Scales Continuous Quantize Quantile Threshold Ordinal			Zoom Zoom Pan
	Shapes Arcs Lines Areas

7

## Observable Notebooks

<https://observablehq.com/explore>

- “Observable helps you use data to think”
  - Explore and visualise data
  - Get ideas/inspiration from existing notebooks
  - Share and publish your insights with the vis community
- Reactive (live) programming
  - Interactive JavaScript notebooks (similar to Jupyter Notebook for Python)
  - Experiment with (big) data in real-time
  - Quickly build and iterate prototypes, re-use code, etc.
  - Supports creation of highly interactive visualisations

# The future of visualisation design?

## Introducing Observable Collaboration

We're excited to announce 🎉 some major improvements to collaboration on Observable: you can now invite up to 4 people to edit or view your notebooks! Collaborators can view each others' edits and cursors in real-time — so called *multiplayer* 🎮. It's like Google Docs or Figma, but with code.

We've been testing these features internally for the past few months, and now welcome your feedback 🙏 on the new editing experience. *Help us make the product better for everyone!* 🍷🙌

To try our improved collaboration, **enable experimental features**. To learn more, read about **Observable Collaboration** and browse **the collection**. 🗨️🗨️

See <https://observablehq.com/@observablehq/introducing-observable-collaboration>

9

## D3 Example: Choropleth Map of NZ

- Shows the distribution of Māori language tweeters across different regions of NZ
  - Self-reported location
  - Some users missing
- TopoJSON defines geospatial positioning
  - <https://github.com/deldersveld/topojson>
- Based on the following tutorial
  - <https://www.dataviscourse.net/tutorials/lectures/lecture-maps/>
- Could be enhanced with simple interaction
- Need to include a legend!

10

## Demonstration: Tinkering with Observable

11

### Vega-Lite via Observable

12

## What is Vega-Lite?

- A high-level grammar of interactive graphics: <http://vega.github.io/vega-lite/>
- Built on top of Vega & D3 (more concise and convenient)
- Declarative: Specify *what* you want the visualisation to include rather than *how* to implement it
- Supports interactive, multi-view graphs
- Has an [online editor](#) but can also use [Observable Notebooks](#)
- See [examples](#) and [tutorials](#)

13

## D3 vs Vega-Lite

- Vega(-Lite) not intended as a “replacement” for D3

Vega provides a higher-level visualization specification language on top of D3. By design, D3 will maintain an “expressivity advantage” and in some cases will be better suited for novel design ideas. On the other hand, we intend Vega to be convenient for a wide range of common yet customizable visualizations. Vega’s design builds on concepts we developed in both [Protovis](#) and D3, and is informed by years of research at Stanford and UW.

As is always the case, the right tool for the job depends on the task at hand. We expect D3 will often be the tool of choice for realizing novel visualization design ideas. For common yet customizable chart types, programmatic generation, and flexible rendering, we believe Vega can further facilitate the use of data visualization across a variety of new tools and web applications.

- See <https://vega.github.io/vega/about/vega-and-d3/>

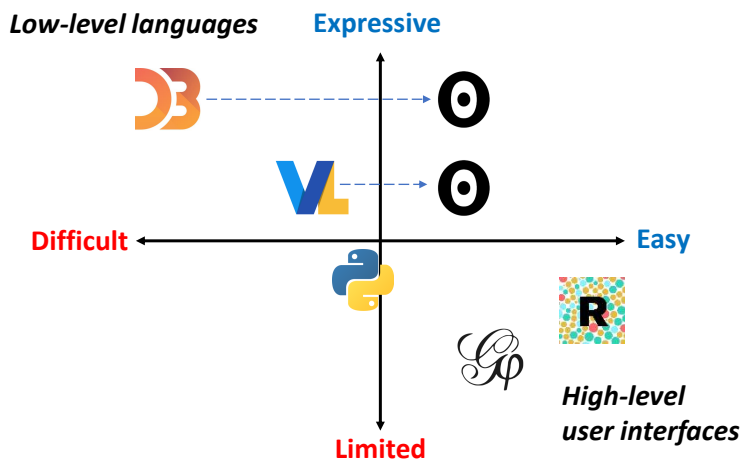

14

## Demonstration: Prototyping with Vega-Lite

15

### Expressiveness vs Usability Revisited

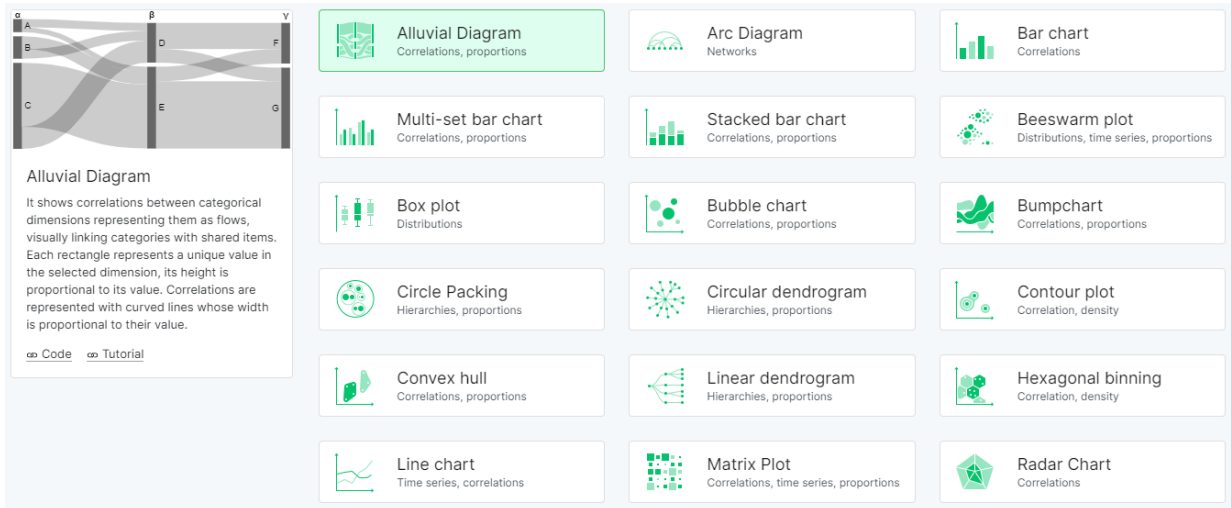

“Visualisation tools sacrifice *generality* for greater *efficiency* performing particular tasks. Code has unparalleled expressiveness; it is the most general tool we have. A medium for discovery *must* be general. Creativity requires composition.”  
 – Mike Bostock, D3 Creator, 2017

16

# RAW Graphs

**Alluvial Diagram**  
It shows correlations between categorical dimensions representing them as flows, visually linking categories with shared items. Each rectangle represents a unique value in the selected dimension, its height is proportional to its value. Correlations are represented with curved lines whose width is proportional to their value.

[Code](#) [Tutorial](#)

 <b>Alluvial Diagram</b> Correlations, proportions	 <b>Arc Diagram</b> Networks	 <b>Bar chart</b> Correlations
 <b>Multi-set bar chart</b> Correlations, proportions	 <b>Stacked bar chart</b> Correlations, proportions	 <b>Beeswarm plot</b> Distributions, time series, proportions
 <b>Box plot</b> Distributions	 <b>Bubble chart</b> Correlations, proportions	 <b>Bumpchart</b> Correlations, proportions
 <b>Circle Packing</b> Hierarchies, proportions	 <b>Circular dendrogram</b> Hierarchies, proportions	 <b>Contour plot</b> Correlation, density
 <b>Convex hull</b> Correlations, proportions	 <b>Linear dendrogram</b> Hierarchies, proportions	 <b>Hexagonal binning</b> Correlation, density
 <b>Line chart</b> Time series, correlations	 <b>Matrix Plot</b> Correlations, time series, proportions	 <b>Radar Chart</b> Correlations

17

## RAWGraphs

- “The missing link between spreadsheets and data”
  - Instantly maps data variables to visual channels
  - Quick and convenient!
  - Uses D3 under the hood
- No programming knowledge required
  - Friendly user interface
  - However, limited layouts available
    - Doesn’t support detailed (low-level) customisation
    - BUT can build custom models with basic understanding of D3

18

## Demonstration: Prototyping with RAW Graphs

19

Python + Gephi

20

# Data Wrangling with Python

- I tend to use Python for cleaning & pre-processing data
  - Other popular alternatives include R and (more recently) JavaScript
- Pandas *data frames* are especially useful for handling datasets with many variables (multi-dimensional data)
  - Rows = data items
  - Columns = variables

```
import pandas as pa
def remove_duplicates(input_file):
    tweets = pa.read_csv(input_file, sep="\t")
    print("Original size: ", len(tweets))
    unique_tweets = tweets.drop_duplicates(subset='id', keep="first")
    print("New size: ", len(unique_tweets))
    unique_tweets.to_csv("rmt-corpus-deduplicated.csv", sep="\t", index=False)
```

21

## Python Pre-processing & Visualisation Libraries

22

# Gephi

- Free, open-source software: <https://gephi.org/users/download/>
- Specifically for drawing *networks*
- Interaction improves readability
  - Hover over a node to see its neighbours
- Can also re-encode & filter attributes
  - Change the appearance (e.g. colour, size) of nodes & edges according to different attributes
  - Filter nodes by attribute values

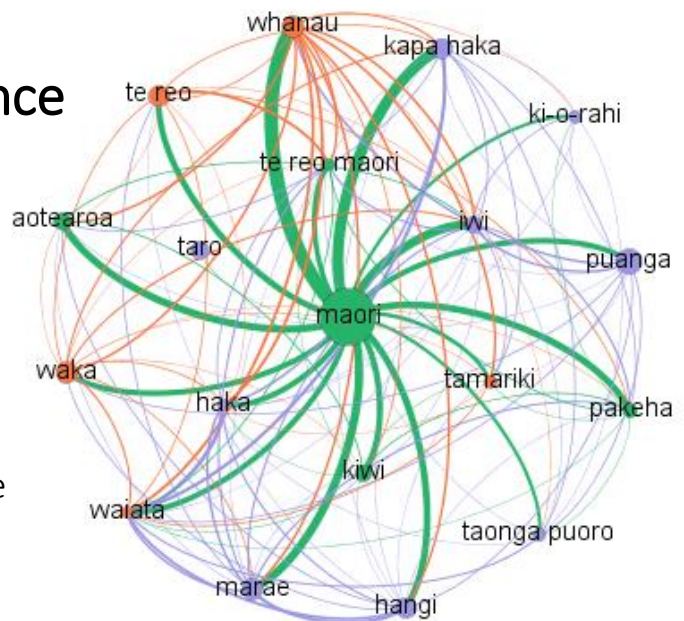

23

## Network Example: Loanword Co-occurrence

- Loanword relationships within NZE newspaper articles/texts
- Limitation: Only shows pairwise relationships!

Nodes = Loanwords  
 Links = Text-level co-occurrence  
 Node Size = Frequency  
 Colour = Semantic type

24

## Process

1. Extracted Māori loanwords in the corpus

2. Built a co-occurrence matrix

- Rows = articles
- Columns = loanwords (1 = present, 0 = absent)

3. Derived loanword pairs and their weights

4. Used Python's *NetworkX* library to export the data into Gephi's GEXF format

- <https://programminghistorian.org/en/lessons/exploring-and-analyzing-network-data-with-python>

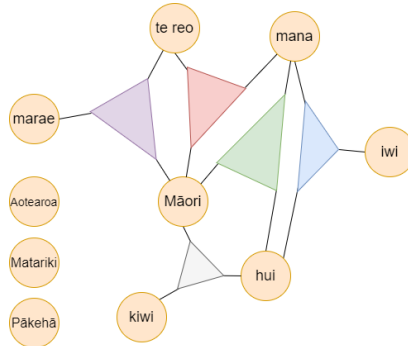

5. Visualised the network in Gephi

	Loanwords			
	L1	L2	...	L140
T1	1	0	...	1
T2	0	1	...	0
...	...	...	...	...
TN	0	1	...	1

source, target, weight  
 aoraki, matariki, 1  
 aoraki, puanga, 1  
 aotearoa, aroha, 1  
 aotearoa, hangi, 2  
 aotearoa, harakeke, 1  
 aotearoa, huia, 2  
 aotearoa, iwi, 2  
 aotearoa, kapa haka, 2

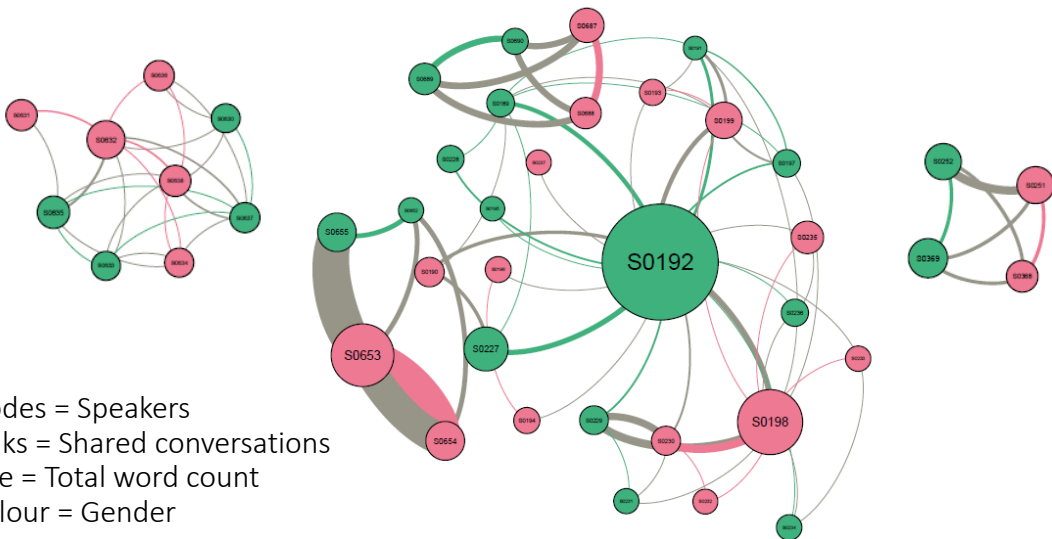

## Demonstration: Creating a Network in Gephi

# Beyond Gephi: $k$ -Uniform Hypergraphs

27

# Network Example: Speakers in the BNC Corpus
